

Solution of Relative-Velocity Equation: Case #1

Scalar-Geometric

$$v_{A/O} = r_0 \omega = r_0 \left(\frac{v_O}{r} \right) = 2 \text{ m/s}$$

$$v_A^2 = 3^2 + 2^2 + 2(3)(2)\cos 60^\circ$$

$$v_A = 4.36 \text{ m/s}$$

ME 231: Dynamics

Sample Problem 5/7

The wheel of radius $r = 300 \text{ mm}$ rolls to the right without slipping and has a velocity $v_O = 3 \text{ m/s}$ of its center O . Calculate the velocity of point A on the wheel for the instant represented.

Solution I (Scalar-Geometric). The center O is chosen as the reference point for the relative-velocity equation since its motion is given. We therefore write

$$\mathbf{v}_A = \mathbf{v}_O + \mathbf{v}_{A/O}$$

where the relative-velocity term is observed from the translating axes x - y attached to O . The angular velocity of AO is the same as that of the wheel which, from Sample Problem 5/4, is $\omega = v_O/r = 3/0.3 = 10 \text{ rad/s}$. Thus, from Eq. 5/5 we have

$$[v_{A/O} = r_0 \dot{\theta}] \quad v_{A/O} = 0.2(10) = 2 \text{ m/s}$$

which is normal to AO as shown. The vector sum \mathbf{v}_A is shown on the diagram and may be calculated from the law of cosines. Thus,

$$v_A^2 = 3^2 + 2^2 + 2(3)(2)\cos 60^\circ = 19 \text{ (m/s)}^2 \quad v_A = 4.36 \text{ m/s} \quad \text{Ans.}$$

The contact point C momentarily has zero velocity and can be used alternatively as the reference point, in which case, the relative-velocity equation becomes $\mathbf{v}_A = \mathbf{v}_C + \mathbf{v}_{A/C} = \mathbf{v}_{A/C}$ where

$$v_{A/C} = \overline{AC}\omega = \frac{\overline{AC}}{OC} v_O = \frac{0.436}{0.300} (3) = 4.36 \text{ m/s} \quad v_A = v_{A/C} = 4.36 \text{ m/s}$$

The distance $\overline{AC} = 436 \text{ mm}$ is calculated separately. We see that \mathbf{v}_A is normal to AC since A is momentarily rotating about point C .

Solution II (Vector). We will now use Eq. 5/6 and write

Helpful Hints

- ① Be sure to visualize $v_{A/O}$ as the velocity which A appears to have in its circular motion relative to O .
- ② The vectors may also be laid off to scale graphically and the magnitude and direction of v_A measured directly from the diagram.
- ③ The velocity of any point on the wheel is easily determined by using the contact point C as the reference point. You should construct the velocity vectors for a number of points on the wheel for practice.
